NO BOX DEV

A technical showcase · **Jasper Middendorp** — No-Box-Dev

ENGINEERING · 2026

Shipping across every surface.

Native macOS, edge & web, mobile, real-time 3D, and AI-native systems — designed, built, and shipped end-to-end by one engineer. This is a tour of the technical work, the hard problems behind it, and where it lives online.

The engineer

Breadth and depth, end to end — from Rust ECS to App Store distribution to Cloudflare edge.

I run No-Box-Dev as a one-engineer software studio: I take products from problem statement to production across whichever stack fits — a sandboxed macOS menu-bar app, a Cloudflare-edge web platform, a Bevy game, or an autonomous agent pipeline. Development is AI-native: agents are first-class collaborators across the whole workspace, not an afterthought. The work below is real, running code.

Full-stack, literally

From low-level Rust/ECS and Keychain crypto up to React UIs and edge APIs — one person owns the whole vertical.

Ship-to-production muscle

Mac App Store, signed + notarized GitHub Releases, Cloudflare deploys, CI/CD — the last mile, not just the code.

AI-native by default

Headless agent orchestration, production LLM pipelines, and MCP-first tooling built into the daily loop.

Systems thinker

Data modeling, ingest + reconcile + dedup pipelines, caching/SWR, sandboxing — the unglamorous parts done right.

Technical capabilities

Five areas, each with the actual engineering it takes to ship — and the products that prove it.

NATIVE MACOS

Sandboxed desktop apps, signable to the Mac App Store

Menu-bar-first (`MenuBarExtra`, `LSUIElement`) apps with no dock icon; Keychain + Touch ID secret storage; hardened runtime + App Sandbox; code-signing, notarization, and fastlane MAS pipelines; global hotkeys; in-app MCP servers over a Unix-domain socket inside the app container.

NoxKey — Keychain manager, noxkey.ai **NoxViewer** — issue triage, signed/notarized **NoxFeed** — sandboxed PR feed

NoxPilot — PIM + MCP-over-socket

EDGE & FULL-STACK WEB

Production apps on Cloudflare's edge

Cloudflare Workers + D1 (SQLite) + R2 + Pages; Next.js static export and OpenNext-on-Workers; GitHub device-flow OAuth with server-proxied token refresh; Hono APIs; Better-Auth; Postmark. Including a multi-tenant AI dashboard with webhook ingestion into D1 and an org-scoped access model.

unticket — app.unticket.ai, source **NoxSpot** — app.noxspot.dev **Boundless Learning** — OpenNext on Workers

112Schade — Next.js 16 + FastAPI + Better-Auth

Technical capabilities, continued

AI-NATIVE SYSTEMS

Agents as infrastructure, and real LLM pipelines

Headless `claude -p` agent orchestration across a multi-project workspace with scheduling and token-exhaustion recovery; a production narration pipeline (GitHub webhook → queue → LLM narrator → D1 store) that turns every PR into first-person team updates; MCP-first server design (tiered tools, directive instructions); local file/git/build watchers that stream agent activity.

Nox Agents — orchestration hub **NoxLink** — agent activity feed **unticket** — narration pipeline **NoxKey** — MCP server

GAMES, 3D & DATA

Real-time engines — and the data behind them

Bevy ECS (Rust) games and a 3D asset hub with a symlinked single-source-of-truth library (`catalog.ron` manifest) that propagates across projects; SQLite data modeling with idempotent ingest + per-row provenance; FastAPI + Vite/React/TS read-only viewers.

Character Gallery — Bevy 3D hub + editor **AidenArena** — Bevy combat game **wow-arena-db** — queryable game-data DB

MOBILE

Native iOS & iPadOS

SwiftUI apps, including an iPad client that pairs to a web backend via pair-code authentication; xcodegen-managed projects for reproducible builds.

Robin — kids reading **Baseline** — health tracking **noboxedu** — iPad for Boundless Learning

Stack & tooling

What the work is built with day to day.

LANGUAGES
Swift, Rust, TypeScript, Python, SQL, Ruby

MACOS
SwiftUI, App Sandbox, Keychain, MenuBarExtra, MCP, fastlane

WEB
React, Next.js, Hono, Vite, Better-Auth

EDGE / CLOUD
Cloudflare Workers, Pages, D1, R2; OpenNext

DATA
SQLite / D1, FastAPI, idempotent ingest pipelines

GAMES / 3D
Bevy, ECS, asset pipelines (RON manifests)

AI
Anthropic SDK, headless agent orchestration, MCP servers

SHIPPING
Mac App Store, signed + notarized releases, GitHub Actions CI

Live & public

What's actually online to point at. Most source is private by default — these are the verified-public surfaces.

No-Box-Dev	noboxdev.com
NoxKey	noxkey.ai — Mac App Store secret manager
NoxSpot	app.noxspot.dev — bug-reporting widget SaaS
unticket	app.unticket.ai · source github.com/No-Box-Dev/unticket
GitHub	github.com/No-Box-Dev — org (most repos private)

NO BOX DEV

Let's build something hard.

One engineer, shipping across native, edge, mobile, and real-time — AI-native from the first commit. If you want a deeper look at any of this, or a conversation about building yours, reach out.
